Himalayan University, Itanagar, Arunachal Pradesh

ABSTRACT

Introduction: Multidisciplinary nature is the most set a part feature of Robotics. To design an excellent robotic system, an engineer must possess knowledge about control engineering, computer engineering, mechanical engineering, industrial engineering, electrical engineering, along with business and economics.

Aim of the study: the main aim of the study is Analysis on the PCA analysis for robotics

Material and method: The research paradigm was a combination of different concepts, variables and other issues related to methodological approaches and other related tools in the research.

Conclusion: Manufacturing systems will continue to rely on humans on the shop floor for decision making and dexterity in assembly tasks, and increasingly for the supervision and maintenance of technical systems and machines

INTRODUCTION

ROBOTICS

Multidisciplinary nature is the most set a part feature of Robotics. To design an excellent robotic system, an engineer must possess knowledge about control engineering, computer engineering, mechanical engineering, industrial engineering, electrical engineering, along with business and economics.

Engineers, through best design procedures and scrupulous observation of details, have flourished in pertaining the science of robotics to a wide range of manufacturing and industrial problems. From a practical standpoint, robots are different from conventional electromechanical motion equipment by their handling abilities, in that robots can operate, position, and move tools and other items with far greater competence than other manufacturing machines.

The automobile sector in the United States was the first to successfully implement process robots on a commercial scale. Mass production of automobiles is no longer possible while respecting the quality and cost levels currently accepted without the use of robots. In early 1995, there were more than 25,000 robots in the American auto industry. Spot welding is the most common application for these robots. For all applications and industries, the global requirement for robots is expected to surpass one million units by 1999.

(IJAER) 2022, Vol. No. 23, Issue No. I, January

Productivity was the main issue in industrial sector which attracted the attention of business leaders at international level during previous decades. Automation is used to modernize the facilities of manufacturing industry by increasing productivity to possible one. Industries are concentrating on automation with the computer-based technology known as computer-controlled robots for improving the productivity and end products with high quality.

LITERATURE REVIEW

Carmo et al. (2019), This software is referred regarded as "robots" because of its inherent ability to accomplish jobs faster, more correctly, and 24 hours a day. Most support functions at banks are located in back-offices, where the tasks done are mostly repetitive and follow a set of rules. RPA automation is a suitable fit for these typesof activities. The banking sector in Portugal is still in the early stages of digitalization. Banks are generally innovative in their front offices, but their back offices, except for a few companies in the industry, still rely primarily on paper and have a low level of automation. This study examined the impacts of the technology in Portuguese bank back-offices and the best practises that should be followed for future deployments to be successful by conducting interviews with subject experts who have been present in RPA installations in banks.

Andrade et al. (2020), Studied on The Challenges of Robotic Process Automation (RPA) for Automated Software Testing. By automating repetitive processes and delivering faster results than a human software tester, repetitive jobs automated using bots save money and extend the life of support. RPA delivers value to business software management, performance, and processes of any complexity in a company. The study's highlights examined the pros and disadvantages of RPA when applied to specific software testing difficulties using features available in both UiPath and Automation Anywhere. Authors' comments, case studies, indicators, and other thorough applications were all mentioned in the analysis of the data obtained for this study project. Pros and drawbacks, cost savings, and effective decision makingwhile picking automation were all compared. Artificial Intelligence (AI) and Machine Learning should be used to improve RPA software testing of business logic in the future (ML).

Madakam et al. (2019), Robotic process automation, essentially. RPA, or robotic process automation, is cutting edge tech. Cutting-edge research in computer science, e-communications engineering, mechanical engineering, and IT has led to the development of robotic process automation (RPA). Simple activities can be accomplished with the use of hardware, software, networking, and automation. Because of this, the research manuscript consulted secondary sources including the Internet and scholarly databases. The duration of the study was from January 1, 2018, to June 30, 2018. RPA, and in doing so, I came across a number of empirical publications, white papers, blogs, and other materials that I used to build my study. This investigation is speculative because of the current phenomenon. Blue Prism, Robotic Process Automation (RPA), Robots, and Artificial Intelligence (AI) were some of the search terms employed. As the research ended, it became clear that robots and robotic process automation technologies are rapidly becoming necessities for running businesses worldwide. Robotic process

(IJAER) 2022, Vol. No. 23, Issue No. I, January

automation is useful for a wide variety of tasks, including but not limited to: employee payroll, employee status changes, new hire recruitment and onboarding, accounts receivable and payable, invoice processing, inventory management, report creation, software installation, data migration, and vendor onboarding. In addition, robotic process automation has many uses in many other sectors, such as healthcare, pharmaceuticals, finance, outsourcing, retail, telecommunications, energy and utilities, real estate, FMCG, and more. RPA's proper placement in business processes is made possible by a slew of ancillary technologies, including AI, ML, DL, DA, DA, HR analytics, VR (second life), HA, BT, BT, blockchain, 4D printing, and others. It also features the work of numerous startups and well-established corporations, including descriptions of the RPA systems they've developed for global use. Academics, researchers, students, and practitioners will all be able to use this publication as a good jumping off point.

Gadre et al. (2020), Digital Transformation is a key component of Industry 4.0. The goal of this article is to look at the fundamentals of Industry 4.0, as well as the trend toward automation and data interchange in manufacturing technologies and processes. This paper offers a strategic roadmap that can serve as a basic guide for manufacturers as they move to Industry 4.0. The industrial and manufacturing worlds have been changed by digital technology. The major goal of this study was to give a general overview of Industry 4.0, as well as the problems and benefits of applying it. It has been discovered that the government and many private sectors are embracing and adapting to the current technological advances. As a result, Industry 4.0 will boost the country's economy by expanding opportunities in key industries such as agriculture, health, manufacturing, and transportation.

ENRÍQUEZ et al. (2020), Automation of Procedures by Robots. There has been a rising tide of curiosity around robotic process automation over the past few years. The majority of studies, however, examine either the theoretical foundations of RPA or the industrial outcomes of RPA deployment in particular settings, especially in finance and outsourcing. To better understand the current state of the art in RPA and to spot the gaps in the scientific and industry literature, this study delivers a comprehensive mapping analysis. First, all 54 seminal works that define the current state of the art in RPA are analysed in detail. These key studies were chosen throughout the systematic review's data collection and analysis phase. Second, this article analyses 14 of the most prominent commercial RPA solutions based on the Forrester RPA study, which establishes a classification scheme based on 48 criteria and analyses the coverage of each of them. The research indicates that the market has found solutions for numerous RPA lifecycle stages. However, analysis is typically left out of technological solutions. At this stage, automation is lacking mostly because there are no technology tools to identify the most promising processes within an organisation for automation. We conclude with a discussion of potential challenges and potential future directions.

(IJAER) 2022, Vol. No. 23, Issue No. I, January

METHODOLOGY

RESEARCH PARADIGM

The research paradigm was a combination of different concepts, variables and other issues related to methodological approaches and other related tools in the research. It includes the structure or framework of scientific ideas in a research study and the values and assumptions used in that study. Morgan (2007) conceptualized different versions of the paradigm. Paradigm versions were described by researchers based on the diversity of knowledge they acquired and the shared beliefs that influenced how they interpreted the information collected. The researchers also showed that a paradigm is nothing but the belief that different members with the same characteristics create the basic aspects of the above research question along with the research method. Therefore, previous research has established the fact that research paradigms are collective processes that include some reasoning processes such as positivism, interpretivism, and constructivism. Researchers have shown that the components of the research paradigm are related to pre-existing understanding of reality assumptions. The researchers also provided explanations about some of the research paradigms for a better understanding of the research paradigms. The current study used the interpretivism research paradigm to develop a conclusion with effective results and better understanding of concepts and facts related to research. Analyzing a person's behavior helps to determine the social world, and accepting a person's opinion helps to analyze the results.

RESULTS

ANALYSIS OF DOCTORS

Table 4.1: Summary of various aspects considered for robotic surgery from doctors

Educational qualification	Master's degree	12	20
	PhD / Mch / DM	48	80
Employment status	Full time	36	60
	Part time	24	40
Income	500001 - 700000	4	6.7
	700001 and above	56	93.3
Working experience with	1 - 5 years	42	70
organization/ healthcare provider	5 - 10 years	6	10
	10 - 15 years	2	3.3
	Above 15 years	10	16.7
Idea of robotic production	Yes	60	100

Extraction Method: Principal Component Analysis.

Rotation Method: Varimax with Kaiser Normalization.

a. Rotation converged in 31 iterations.

CONCLUSION

Manufacturing systems will continue to rely on humans on the shop floor for decision-making and dexterity in assembly tasks, and increasingly for the supervision and maintenance of technical systems and machines, despite long-held industrial aspirations for fully automated 'lights out' systems with no direct human input. Even though human issues and behaviour are known as fundamental influences on overall system performance, they have not been considered properly in

(IJAER) 2022, Vol. No. 23, Issue No. I, January

the design or redesign of industrial systems in the past. It's been known for a long time that failing to properly account for human factors is at the heart of why so many attempts to deploy modern industrial techniques have failed. Despite the growing recognition of the need to better include human aspects into the engineering design of industrial systems and work processes, this focus is sometimes a step or two behind the more traditional emphasis on expanding technical capacity. Human ethical concerns in the context of emerging intelligent, interconnected, and cyberphysical systems are, therefore, likely to receive less attention.
